

## Client Import Facility - Scope & Requirements

**Project:** CRM Client Master Import Module

**Purpose:** Enable authorized users to bulk import client records through an Excel template while validating data quality, preventing duplicates, and generating an import summary.

### 1. Objectives

- Provide bulk client creation through Excel.
- Validate mandatory fields and lookup values.
- Prevent duplicate client creation.
- Auto-generate Client Code.
- Generate detailed success/failure logs.

### 2. Import Template

| Field               | Mandatory | Validation                   |
|---------------------|-----------|------------------------------|
| Client Name         | Yes       | Cannot be blank              |
| Mobile              | Yes*      | 10 digits, numeric           |
| Email               | Yes*      | Valid email format           |
| City                | Yes       | Must exist in City Master    |
| Country             | Optional  | Must exist in Country Master |
| Source              | Optional  | Must exist in Source Master  |
| Type                | Optional  | Individual / Organization    |
| Organization Name   | Optional  | Text                         |
| Organization Type   | Optional  | Text                         |
| Registration Number | Optional  | Text                         |
| Designation         | Optional  | Text                         |
| Website             | Optional  | Valid URL (if provided)      |
| Postal Code         | Optional  | Numeric                      |
| Address             | Optional  | Text                         |
| Remarks             | Optional  | Text                         |
| Status              | Optional  | Active / Inactive            |

### 3. Validation Rules

- Mandatory: Client Name with Mobile and Email.
- Mobile: Numeric, 10 digits.
- Email: Standard email format.
- City/Country/Source: Values must exist in respective master tables.
- Status: Active or Inactive only.
- Type: Individual or Organization only.

### 4. Duplicate Validation

The system will treat a record as duplicate if either:

- Mobile Number already exists, OR

- Email Address already exists.

Duplicate records will not be imported. This feature supports INSERT only; existing clients will not be updated.

## 5. Internal Mapping

Users will provide readable values (e.g., Delhi, Referral). The application will internally map these values to the corresponding master IDs. Internal numeric IDs will never be exposed in the import template.

## 6. Import Process

1. Download Template
2. Upload Excel
3. Validate File Structure
4. Validate Data
5. Duplicate Check
6. Insert Valid Records
7. Auto-generate Client Code
8. Generate Summary & Error Log

## 7. Import Summary

After completion, the system will display:

- Total Records Processed
- Successfully Imported
- Failed Records
- Download Error Report

## 8. Error Report

| Row No. | Client Name | Mobile     | Reason                   |
|---------|-------------|------------|--------------------------|
| 5       | Rahul       | 9643430934 | Duplicate Mobile         |
| 9       | Amit        | 9876543210 | Invalid City             |
| 14      | Mohit       |            | Mobile or Email Required |
| 18      | Sunil       | 9999999999 | Invalid Source           |

## 9. Out of Scope

- Updating existing clients through import.
- Deleting clients through import.
- Merging duplicate clients.
- Auto-creating missing master records.
- Partial updates.

## 10. Assumptions

- Client Code is always auto-generated.

- Lookup masters already exist.
- Only one worksheet is supported.
- Users will use the prescribed template.

## **11. Recommendation**

It is recommended to provide a 'Download Template' option with a reference sheet listing valid values for City, Country, Source, Type and Status. This minimizes import errors and improves user experience.
